

Sky Transport — QA Test Fixtures Guide

Manual test documents for the Shipment Document Data Extractor, for exercising the live upload & extraction path end to end.

Purpose

The app ships with built-in “try a sample” buttons that replay pre-recorded extraction results without calling OpenAI, so a reviewer can see the workflow even without an API key configured. The three fictional Bills of Lading in this guide are for the opposite purpose: uploading a real file through the dropzone and exercising the actual live extraction call (**POST /api/extract** → OpenAI’s vision model → parsed JSON fields), end to end.

For each fixture below, the “Expected fields” table is the ground truth the document was generated from — compare it against what the app actually extracts to confirm the live pipeline is producing correct results.

How to test

1. Open the deployed app and log in (email/password or Google).
2. Drop one of the three PDFs into the upload dropzone (or click “browse”) and click Extract.
3. Compare the extracted fields shown in the form against the Expected fields table for that document.
4. Click “Add to table” to also exercise the Supabase insert and the “shipment added” notification email.

1. Summit Hardware Supply → Redwood Building Co.
